(54) Title: DEVICE FOR THE CONTINUOUS TESTING OF MATERIALS

(57) Abstract: The present invention relates to a device for the continuous testing of at least two building blocks, which are part of a combinatorial material library. Thereby, said device is in particular characterized in that it comprises at least the following constituent parts: (i) at least one spatially stationary component with at least one means for supply, (ii) at least one spatially non-stationary component as well as (iii) at least one unit for the uptake of a building block. Thereby, at least one building block moves spatially relative to the at least one other building block during the testing.
